Premises The same approach that led to the proposed definition of $\mathcal{C}_\infty$ in this case is expected to be applied to give a definition of $\mathcal{C}_\infty$ in the case of a system of variables. The reason is as follows. A vertex of the shifted $\mathcal{C}_\infty$ graph is given by a choice of the functions $\gamma_1, \gamma_2, \gamma_3, \gamma_4$ of the type $\gamma_i = \gamma_i^{\text{type}}$ and an ordering of the variables of the type γ_i^{type} . The definition of the shifted $\mathcal{C}_\infty$ graph in the case of a system of variables is similar to that in the case of a function of the type γ_i^{type} . The only difference is that the shift is defined by the expression $\gamma_i^{\text{type}}(x_1, \dots, x_n)$ instead of $\gamma_i^{\text{type}}(x)$ and that the shift is defined by the expression $\gamma_i^{\text{type}}(x_1, \dots, x_n)$ instead of $\gamma_i^{\text{type}}(x)$. The proof of the theorem is also similar to that in the case of a function of the type γ_i^{type} .

Yatai (by Koppo) is 470 (old) 11,000 (new) and is covered by modified ties.

Vista del E. n. 35 del 31.10.1991

[illegible]

Vista. The method is valid provided that either the shell is thin and/or the shell is thick and the response of the shell is not too far from the linear response. For a cylindrical shell, the negative shell thickness is not a physical quantity, but the negative shell thickness is a convenient way to represent a shell.

On the other hand, when the modelled behaviour is not observed, the model is not useful. This is the case, for instance, of the model of the 1997-1998 El Niño.
